

RACKET WITH CAPABILITY OF VIBRATION ABSORPTION

ABSTRACT OF THE DISCLOSURE

A racket includes a frame having a rim and a connection portion at an end of
5 the rim, a handle fixed at a distal end of the connection portion, an elastic member
attached on a predetermined portion of the frame, and a cover layer wrapped around
the frame and the elastic member. The vibration wave transmission velocities of the
frame, the elastic member and the cover layer are different from one another and the
vibration is therefore reduced while transmitting therethrough.
